Which mechanism does the FireAMP Connector use to avoid conflicts with other security applications such as antivirus products?

- A. exclusions
- B. virtualization
- C. containers
- D. sandboxing

Correct Answer: A

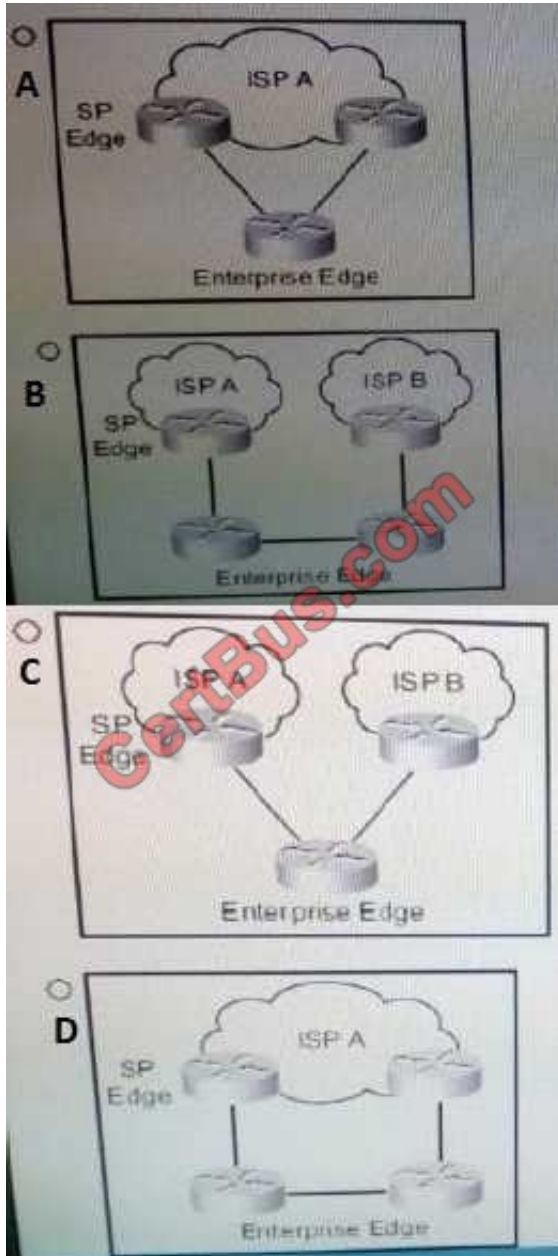

To prevent conflicts between the FireAMP Connector and antivirus or other security software, you must create exclusions so that the Connector doesn't scan your antivirus directory and your antivirus doesn't scan the Connector directory. This can create problems if antivirus signatures contain strings that the Connector sees as malicious or cause issues with quarantined files. The first step is to create an exclusion by navigating to Management > Exclusions in the FireAMP

console.
